

ABSTRACT OF THE DISCLOSURE

A composite type card connector of the present invention includes a connector body, a cover member,
5 first contact members for a small card, second contact members for a large card, and a switching operation mechanism having a movable plate and a operating plate, such that a card-mounting section in the connector body is switched to another one by the switching
10 operation mechanism so that two kinds of cards different in thickness and/or width can be commonly inserted into the same composite type card connector.
